Abstract

Halophilic, thermophilic and alkaliphilic [extremophiles](#) are directly exposed to extreme environmental conditions of salinity, temperature and pH, respectively. Understanding of genomic and proteomic molecular mechanisms of adaptation developed by these extremophiles is important in biotechnological applications. Genomic and proteomic signatures of halophilic, thermophilic and [acidic and alkaliphilic](#) proteins have been discussed in this review. Halophilic proteins have evolved with a highly negatively charged surface and a hydrophobic core. Thermophilic proteins have evolved with compact structures and increased ionic interactions. Acidic and alkaliphilic proteins have evolved with a highly negatively charged surface. Cutting tools to molecular mechanisms of adaptations have been discussed in this review.

Keywords

Thermophile adaptation; Halophilic adaptation; Ph adaptation; Genomic signatures; Proteomic signatures

1. Introduction

The [extremophiles](#) are microorganisms characterized by molecular mechanisms of adaptations to extreme environmental conditions of salinity, temperature, pH, pressure, radiation, and chemicals (Rothschild and Mancinelli, 2001). [Cell viability](#) is obviously dependent on proteins that are directly exposed to extreme conditions. Therefore, the molecular mechanisms of adaptations of these proteins are important in biotechnological applications (Gupta et al., 2015). Halophilic proteins have evolved with a highly negatively charged surface and a hydrophobic core (Dym et al., 1995; Frolow et al., 1996; Fukuchi et al., 2003; Kastritis and Gumbart, 2013; Kumar et al., 2007; Lanyi, 1974; Madern et al., 2000; Mevarech et al., 2000; Oren, 2002; Paul et al., 2008; Richard et al., 2001; Siglioccolo et al., 2011; Tadeo et al., 2009; Talon et al., 2015; Tokunaga et al., 2005; Zaccai, 2000). Thermophilic proteins have evolved with compact structures and increased ionic interactions (Bae et al., 2000; Berezovsky et al., 2003; Bhardwaj et al., 2006; Bhardwaj et al., 2007; Bhardwaj et al., 2008; Bhardwaj et al., 2010; Bhardwaj et al., 2011; Bhardwaj et al., 2012; Bhardwaj et al., 2013; Bhardwaj et al., 2014; Bhardwaj et al., 2015; Bhardwaj et al., 2016; Bhardwaj et al., 2017; Bhardwaj et al., 2018; Bhardwaj et al., 2019; Bhardwaj et al., 2019; Bhardwaj et al., 2019
